PITCH DECK · OCTOBER 2026

Give every AI agent a *quantum computer.*

A simulation gate decides which jobs deserve real quantum hardware, so agents can use the most expensive compute on Earth without wasting a second of it.

FOUNDER
Santhosh Balasa

COMPANY
Yabloko Labs Ltd

BASED IN
London · Bengaluru

01 — WHY NOW

Everything around you started as *a thought* in someone's mind.

THEN

Ideas needed permission.

Degrees, capital, a team. For most people, a thought stayed a thought.

NOW

AI agents turn ideas into execution.

You don't need to be a scholar any more. You need an idea, and agents write, test and ship it.

NEXT

Agents are getting their own computers.

Shells, browsers, sandboxes: today's agents have a workstation. The next machine they will reach for is a **quantum computer**, for the problems classical machines can't crack.

02 — THE PROBLEM

Agents learn by trying. On a quantum computer, *trying is expensive.*

COST

$96 / min

IBM's pay-as-you-go list price for QPU time, billed per second. Every second of quantum hardware is metered.

BEHAVIOUR

∞ retries

Agents iterate freely on CPUs. Pointed straight at a QPU, that same loop burns budget on jobs that were never going to work.

UNCERTAINTY

“It depends”

In our own benchmarks, quantum methods won at one problem size and lost at another. Someone has to decide, **job by job**, whether quantum is worth it.

Price: IBM Quantum pay-as-you-go plan, published starting rate (“from $96/min”). Benchmark detail on slide 6.

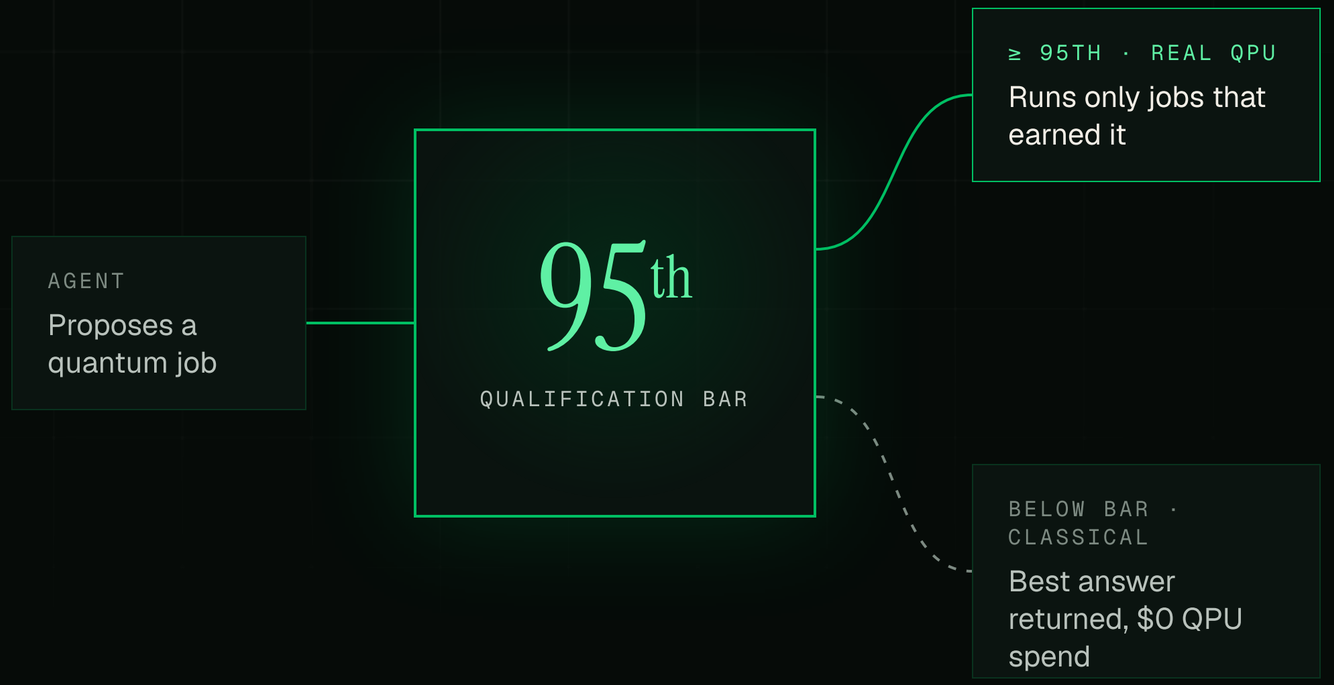

03 — THE PRODUCT

A simulation gate between the agent and *the quantum hardware.*

Every quantum job an agent proposes is run first on a simulated layer and benchmarked against the best classical answer.

Only jobs that score in the **95th percentile or above** qualify for real quantum hardware. Everything else gets the classical answer, and costs nothing on the QPU.

> *"The agent may propose. The gate decides what reaches the hardware."*

04 — HOW IT WORKS

From an agent's goal to *a qualified quantum run*, in five steps.

01

Intent

The agent states a goal. The QuantumClaw planner breaks it into concrete decisions.

02

Encode

Decisions go into a backend-neutral IR, then compile to QUBO / BQM form. Gate-model circuits come next.

03

Simulate

Run on CPU emulators of quantum annealing and on classical solvers in parallel, at near-zero cost.

04

Score

Benchmark against a classical shadow plan. Score ≥ 95th percentile means the job is **qualified**.

05

Execute

Qualified jobs run on real QPUs (D-Wave today, via our Ocean sidecar). Results return to the agent.

↻ Every run is scored and stored as a reusable skill, so the gate gets sharper with every job it sees.

05 — EARLY EVIDENCE

No backend always wins. *So the gate is the product.*

MEDIAN ROUTE COST · Q-ROUTER BENCHMARK · LOWER IS BETTER

Bars start at 0. Emulator at 10 stops: best seed shown (range 520.7-538.2).

10% shorter

At 8 stops, the quantum-annealing emulator beat the classical heuristic (441.5 vs 490.8).

4% longer

At 10 stops it lost (≥ 520.7 vs 500.9). A fixed “always quantum” rule would have been wrong.

Measure first, then spend. The gate picks the winner per job, before any QPU second is billed.

Source: QuantumClaw scripts/benchmark_sweep.py. Deterministic instances, 5 repeats × 2 seed bases. The annealing emulator (dwave-sqa) runs on CPU and is not quantum hardware. Small sample, so read as directional.

06 — WHAT ALREADY EXISTS

Not just a slide. *The foundation is already shipping.*

QuantumClaw

Rust agent runtime with hybrid classical + quantum-inspired planning, a policy gate, and pluggable solvers up to a real D-Wave QPU.

RUST · V0.3.0 ON CRATES.IO · MIT

quantumclaw-dwave

Python sidecar that connects the runtime to D-Wave Ocean: simulated annealing, annealing emulator, Leap hybrid and QPU.

PYTHON · ON PYPI

quantum-annealing-accelerator

p-bit Ising machine in synthesizable SystemVerilog, plus a digital twin. 95% success on 8-spin Max-Cut in simulation.

SYSTEMVERILOG · PYTHON · REACT

quantum-instruction-cache

Deterministic instruction cache and prefetch engine for quantum pulse instructions.

SYSTEMVERILOG

minn-sim

Matchgate simulator for a measurement-induced quantum neural network, with proofs in Lean 4.

RUST · LEAN 4

truthlens

AI hallucination detector with formally verified trust scoring: the same “score before you trust” idea as the gate.

RUST

104 public repositories at github.com/yablokolabs: quantum, agents, Rust/C++ systems, avionics, formal methods.

07 — TRACTION

I've already taken quantum to *governments, ports and enterprises.*

QUANTUM PITCHES

EU

Horizon Europe consortium proposal

Pitched a hybrid quantum optimisation project as part of an EU consortium, with D-Wave involved.

AUG 2025

Visakhapatnam Port Authority, India

EOI for Q-Port Optimizer: berths, cranes, yard slots and truck routes co-optimised as one QUBO on a hybrid quantum pipeline.

Where the gate idea came from: every quantum plan we proposed needed a classical fallback. The gate makes that choice automatically.

DELIVERY

LIVE

AB InBev, via Watchtower

Multi-country marketing mix modelling platform across Brazil, Korea, Colombia, Argentina and the USA.

DEFENCE

NG-MIMA, with Indra Sistemas

Technical capability partner on next-gen military avionics: C++ proof of concept in an EU programme of 26 entities.

PRODUCTS

Q-Router · Q-AdMix · Q-Porter · Q-Consent

Quantum-inspired products for routing, ad attribution, port logistics and consent.

08 — THE FOUNDER

“I'd introduce myself as just a human, and my home is *planet Earth.*”

SB

Santhosh Balasa

Founder & CEO · Yabloko Labs

15+	30×	104
YEARS ENGINEERING	C++ SPEED-UP DELIVERED	PUBLIC REPOS

- → **Hands-on builder.** Writes the code, not just the slides: C++, Rust, Python, SystemVerilog.
- → **30× performance gain** in C++ for a global, industry-leading client.
- → **Enterprise scale.** Architected analytics platforms for Fortune 500 clients: Kubernetes, async systems, CI/CD.
- → **High-assurance pedigree.** Avionics PoC, defence programmes, secured data-centre environments.
- → **Quantum stack.** Qiskit, Cirq, PennyLane, D-Wave Ocean, tensor networks; formal verification in Lean 4.
- → **Founded Yabloko Labs in 2025.** Registered in the UK and India (DPIIT-recognised startup).

09 — WHO PAYS

Three buyers, one promise: *pay for quantum only when it wins.*

ENTERPRISES

Hard optimisation problems

Logistics, ports, ad spend, finance. Pay per gated job plus a subscription, and only pay QPU prices when the QPU actually wins.

QUANTUM CLOUDS

Fewer, better jobs

The gate sends providers qualified workloads with real results, so their customers come back. We take a revenue share on routed QPU spend.

AGENT PLATFORMS

Quantum as a tool

A drop-in tool (MCP / skill) gives any agent safe access to quantum hardware, with budget limits and audit built in.

$1B+

Revenue earned by quantum computing companies in 2025, projected to reach up to **$4.4B by 2028**.

$1.3–2.7T

Economic value quantum could create for companies worldwide by 2035.

Source: McKinsey Quantum Technology Monitor 2026.

10 — ROADMAP

Thinking ten years ahead, *shipping every week.*

TODAY

Runtime live

QuantumClaw 0.3 on crates.io. Classical, emulator and D-Wave backends behind one interface.

+6 MONTHS

Gate MVP

Scoring against classical shadow plans, the 95th-percentile qualifier, and a cost report for every job.

+12 MONTHS

Multi-QPU

Annealing plus gate-model providers. MCP tool for any agent. First 3 design partners in logistics.

+3 YEARS

Default layer

The standard routing layer between AI agents and quantum clouds.

+10 YEARS

Quantum, like GPUs

Any agent reaches a quantum computer as easily as it reaches a GPU today.

11 — WHY EWOR

I can build almost anything. *I want help building one company.*

WHAT I BRING

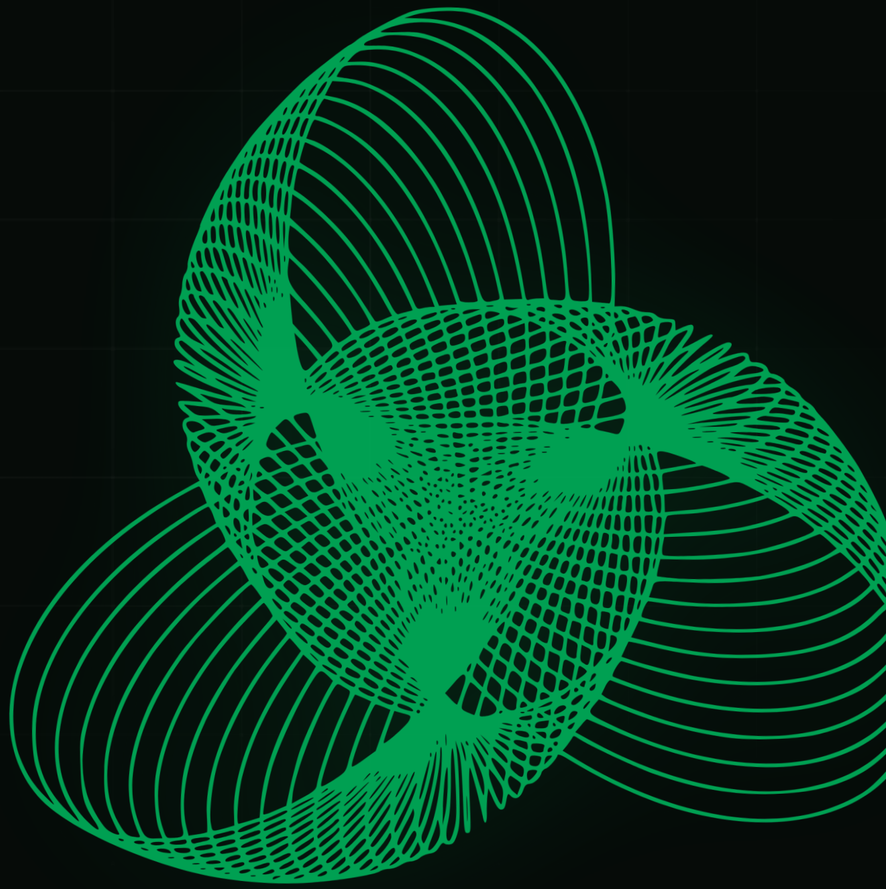

+ A working quantum agent runtime, published and open source
+ Depth from silicon (SystemVerilog) to agents (Rust, LLMs)
+ Quantum proposals already in front of the EU and Indian ports
+ Enterprise and defence delivery experience in Europe

WHAT I NEED FROM EWOR

? **Focus:** turning a studio of many products into one company
? **Go-to-market** mentorship from founders who have scaled
? **Capital** for QPU benchmarking credits and the first two engineers
? **Introductions** to quantum cloud providers and European design partners

LET'S BUILD IT

Give agents the hardest computer on Earth, and *make every second count.*
